

METHOD FOR BINDING A SOFTWARE DATA DOMAIN TO SPECIFIC
HARDWARE

ABSTRACT OF THE DISCLOSURE

5

10 A copy protection program for securely holding digital
audio and/or video content is bound to a particular device
via a key derived in part from unique or distinctive
hardware, software and/or firmware identifiers within the
device and in part from a random or pseudo-random number.
The key is checked or rebuilt whenever the copy protection
program is employed to access protected digital content,
either authorizing/prohibiting such access to the content
or enabling/precluding proper decoding of the content.
15 Therefore the digital content need not be directly bound to
the device while circumvention of the copy protection is
frustrated.
